- Barnacles attach to a variety of substrates.
- There are such sea organisms, dolphins, whales and other animals.

Topic-04: Sub-Phylum Chelicerata

Class Pycnogonida:

- Members of the class Pycnogonida are the sea spiders.
- All are marine.
- They are more common in cold waters.
- Pycnogonida live on the ocean floor.
- They feed on sedentary worms and octopuses. Some sea spiders feed by sucking prey tissues through a proboscis.

Reproduction:

- Pycnogonids are dioecious.
- Gonads are U-shaped, branches of the gonads extend into each leg.
- Gonopheres are present on one of the pair of legs.

Topic-05: Further Phylogenetic Considerations

1. **Polyphyletic lineage:**

© Copyright Virtual University of Pakistan

Many zoologists believe that the living arthropods should be divided into three separate phyla (Chelicerata, Crustacea and Uniramia).

2. **Monophyletic origin:**

All four subphyla are present in the fossil record from the early Paleozoic era. There are currently no known fossils of arthropods from Precambrian times.

96 / 151

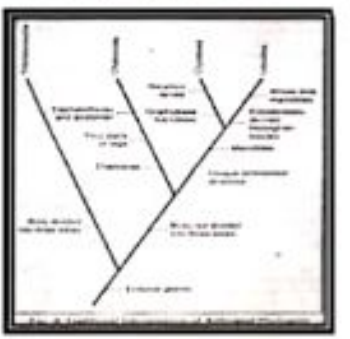

Fig. Further phylogenetic considerations

Scanned with CamScanner

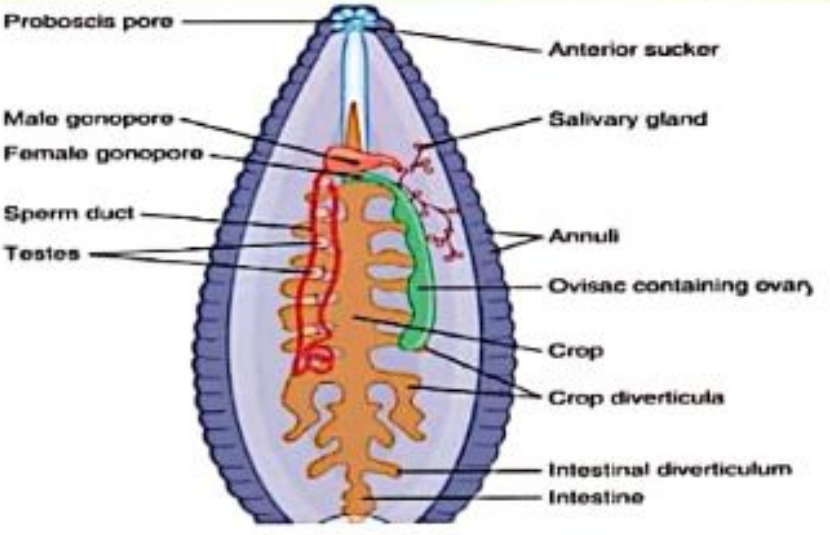

Leeches lack parapodia and head appendages.

- Setae are absent in most leeches.
- In a few species, setae occur only on anterior segments.
- Leeches are dorsoventrally flattened and taper anteriorly.

External Structure and Locomotion

- They have 34 segments, but the segments are difficult to distinguish externally because they have become secondarily divided.
- Several secondary divisions, called annuli, are in each true segment.
- Anterior and posterior segments are usually modified into suckers.

anticoagulant 1 of 1

CLASS HIRUDINEA

Topic – 110: External Structure and Locomotion:

- Leeches lack **parapodia** and head appendages.
- **Setae** are absent in most of leeches and if present occur in anterior segments.
- Leeches are dorsoventrally anteriorly and have **34 segments**.
- The **musculature** of leeches is more complex than annelids.
- A layer of oblique muscles is present between the circular and longitudinal muscles and responsible for the flattening of leech.
- The leech has a single **hydrostatic cavity**. It uses a looping type of locomotion.

External structure of Hirudinea

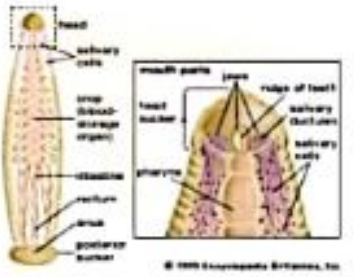

Topic – 111: Feeding and the Digestive System:

- Many leeches feed on **body fluids**. They may eat the bodies of other invertebrates. Some feed on the **blood** of vertebrates, including human blood.
- Leeches are parasites. Leeches are not specie specific.
- **The** mouth of a leech opens in the middle of the anterior sucker.
- In some leeches, the anterior digestive tract is modified into **a protrusible proboscis.**
- **Salivary glands** secrete an anticoagulant called hirudin. **Hirudin** prevents blood from clotting.

Digestive System:

- The leech starts its **digestive system** with the jaws, three blades set
- In feeding they slice their way through the skin of the host, leaving **a Y-shaped incision.**
- In the crop, some blood-sucking species can store up to five times the body mass of blood.

Digestive system of Hirudinea

Metamerism and Tagmatization

- Metamerism permits the specialization of regions of the body for specific functions.
- This regional specialization is called tagmatization. In arthropods, body regions, called tagmata (sing. tagma), are specialized for feeding and sensory perception, locomotion, and visceral functions.
